Product Funnel Analysis for Marketing Company

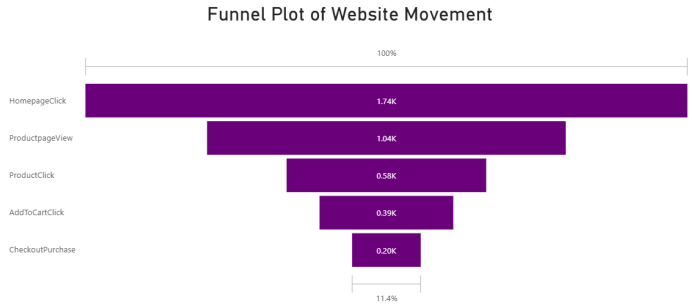
Executive Summary

Using SQL python and PowerBI I pulled customer action data from the database and created a dashboard to track website orders through the funnel. After identifying opportunities to increase user rate and check-out attempts, I recommend the team to implement a few adjustments that may lead to higher conversion:

1. Easier access to “Add to Cart” button
2. Reminder emails/texts
3. Quicker Checkout page

Business Concern

Completed orders are essential for this Marketing company as they’re directly liked to revenue. Stakeholders noticed that overall, there is a lower conversion rate that expected based on those who enter our website vs. those who complete the order. How can we determine where users are dropping out of the workflow?



Methodology

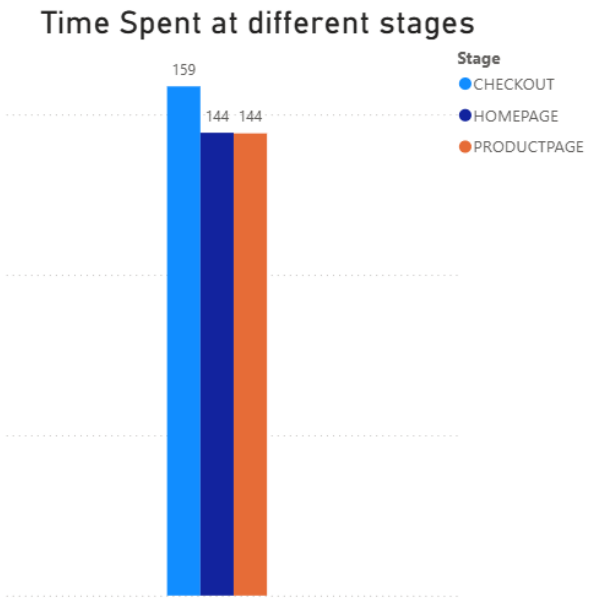
1. SQL query that extracts. Cleans and transforms data from the database
2. Dashboard in PowerBI that tracks movement in each stage

Skills

SQL: CTEs, Joins, CASE and aggregate functions
PowerBI: DAX, Data Visualisation, Data Modeling
Python: Pandas, Matplotlib, Numpy

Results & Business Recommendations:

Creating a dashboard to track step movement with the website till check-out gives stakeholders visibility into the funnel overall and for specific products. Now stakeholders can self serve and the analysts team can save 2 hours in time on issue. The analysis shows that almost 40% of customers drop off even before they enter the products’ landing page and 11.4% end up purchasing an item. According to duration tracking, more time is spent on average at the check-out page that searching through the products landing page.



Because the biggest revenue impacts will come form increasing the interaction on the website and completed checkout, I recommend a few adjustments:

1. Have a floating “Add To Cart” button to reduce time spend on the product page before adding
2. Send reminder emails and texts to customers who leave items in the cart or who viewed the item without proceeding to check out
3. Improve checkout page to reduce time spent

I believe these adjustments will tackle the largest fallout point and increase conversion rate and therefore revenue and save analysis team time from a decrease in ad hoc requests.

Next Steps:
1. A/B test on the changes
2. Track email and text open and click rates
